

Lindsey's Skyward Bald Cypress

Taxodium distichum 'Skyward'

Height: 20 feet

Spread: 10 feet

Sunlight: ○

Hardiness Zone: 4b

Description:

A genuinely attractive tree for many reasons; its columnar, upswept habit, thread-like foliage held in dense clumps along the ascending branches, turning rusty orange-brown in fall, curious knobby knees when planted near water; a stunning accent tree

Ornamental Features

Lindsey's Skyward Bald Cypress has emerald green foliage throughout the season. The ferny bipinnately compound leaves turn an outstanding harvest gold in the fall. Neither the flowers nor the fruit are ornamentally significant. The shaggy silver bark and indian red branches add an interesting dimension to the landscape.

Landscape Attributes

Lindsey's Skyward Bald Cypress is a dense deciduous tree with a strong central leader and a narrowly upright and columnar growth habit. Its relatively fine texture sets it apart from other landscape plants with less refined foliage.

This is a relatively low maintenance tree, and is best pruned in late winter once the threat of extreme cold has passed. Deer don't particularly care for this plant and will usually leave it alone in favor of tastier treats. It has no significant negative characteristics.

Lindsey's Skyward Bald Cypress is recommended for the following landscape applications;

- Accent
- Shade
- Vertical Accent

Planting & Growing

Lindsey's Skyward Bald Cypress will grow to be about 20 feet tall at maturity, with a spread of 10 feet. It has a low canopy with a typical clearance of 5 feet from the ground, and is suitable for planting under power lines. It grows at a slow rate, and under ideal conditions can be expected to live to a ripe old age of 100 years or more; think of this as a heritage tree for future generations!

This tree should only be grown in full sunlight. It is an amazingly adaptable plant, tolerating both dry conditions and even some standing water. It is not particular as to soil type, but has a definite preference for acidic soils, and is subject to chlorosis (yellowing) of the leaves in alkaline soils. It is somewhat tolerant of urban pollution. Consider applying a thick mulch around the root zone in winter to protect it in exposed locations or colder microclimates. This is a selection of a native North American species.
